What is SQL injection?

Sql injection is a web vulnerability that allows an attacker to interface with the queries that an application makes to it's database. It generally shows that data that they are not normally able to retrieve. This might include data belonging to other user's, or any other data that the application itself is able to access. In many cases, an attacker can modify or delete this data, causing persistent changes to applications content and behavior.

In some situations, an attacker can escalate an SQL injection attack to compromise the underlying server or other back end infrastructure, or perform a denial of Service attack.

But after that, nothing happened.

Let's try to change cookie into true

Okey it worked.
